The flexible **SPIDEX**® coupling transmits the torque positively and reliably. Elastic couplings reduce short-term torque shocks by temporarily elastic storage of some of the shock energy. The ball-shaped involute tooth allows the balancing of radial and angular displacements of the shafts to be connected.

## 1.0 General Information:

In order to ensure smooth operation of the jaw coupling, the coupling must be dimensioned according to the design regulations DIN 740 Part 2, depending on the application. See page 9 for instructions on the selection process. In the event that the operating conditions of the application change, a new coupling design is mandatory.

Read these assembly instructions carefully before installing the SPIDEX® jaw coupling. Pay special attention to the safety instructions!

The assembly instructions are part of your product. Keep them carefully and close to the SPIDEX® jaw coupling.

SPIDEX® jaw couplings with identification according to 10.3.1 are suitable for use in explosive atmospheres. Please observe the information in the chapter "Important information in explosion hazard areas".

The copyright of these assembly instructions remains with **R+L Hydraulics** GmbH.

### 1.2 General Hazard Information:

During assembly and disassembly of the SPIDEX® jaw coupling ensure that the entire driveline is isolated and protected against accidental switchon and the system is depressurized. Improper handling of rotating parts can cause serious injury. It is therefore essential to read and follow the following safety instructions.

- All work with the SPIDEX® jaw coupling must be carried out under the aspect of "safety first".
- Isolate the drive unit before using the SPIDEX® jaw coupling Carrying out work.
- Isolate the drive unit against unintentional switching on, e.g. by posting alert signs to the switch-on point or remove the fuse on the power supply.
- Do not reach into the working range of the coupling when it is still in operation.
- Secure rotating drive parts from accidental contact. Attach appropriate protective devices and covers.

### 2.0 Intended Use

You may only install, operate and service the SPIDEX® jaw coupling if you:

- have read and understood the assembly instructions carefully
- are authorized and professionally trained

The SPIDEX® jaw coupling may only be used in accordance with the technical specifications. Unauthorized structural modifications of the SPIDEX® jaw coupling are not permitted. We do not assume any liability for resulting damage. In the interest of further development, we reserve the right to make technical revisions. The SPIDEX® jaw coupling described here corresponds to the state of the art at the time of printing of this assembly instruction. The SPIDEX® jaw coupling is generally supplied ready for assembly.

### 2.1 Note on the EC Machinery Directive 2006/42/EC

Couplings supplied by R+L Hydraulics are considered as components and are not to be classified as machines or incomplete machines within the meaning of EC Machinery Directive 2006/45/EC. Consequently, R+L Hydraulics does not have to issue a declaration of incorporation. For safe installation and operation, please observe the warning notices in these operating/assembly instructions.

### 3.0 Storage, Transport and Packaging

### 3.1 Storage

The following chapter covers storage instructions for the SPIDEX® jaw coupling:

• coupling hubs can be stored in a covered, dry place for 6-9 months.

• the characteristics of the coupling ring gears remain unchanged for up to 5 years under favorable storage conditions.

Storage rooms must not contain ozone-producing devices, such as fluorescent light sources, mercury vapor lamps or electrical highvoltage devices. Damp storage rooms are unsuitable. Care must be taken to ensure that no condensation occurs. The favorable relative humidity is below 65%.

### 3.2 Transport and Packaging

To avoid injuries and various types of damage, always use suitable means of transport and lifting equipment.

Couplings are packaged differently depending on the dimensions/size, quantity and type of transport. If no packing instructions have been agreed upon at the time of placing the order, the packaging shall be in accordance with the internal packaging regulation of R+L Hydraulics GmbH

### 5.0 Assembly

The SPIDEX® jaw coupling is generally supplied ready for assembly.

### 5.1 Assembly Instructions

We recommend checking the dimensional accuracy of the bore, shaft, groove and key before assembly.

By slightly heating the hubs to approx. 80  $^{\circ}$ C, it is possible to apply them to the shaft more easily.

Touching the heated coupling hubs may cause burns. Always wear safety gloves during assembly.

During assembly, ensure that the E dimension, see Table 1-3, is maintained for the spider to remain axially movable in use. In the event of disregard, the coupling cannot operate correctly and possibly incur damage.

Pay attention to the risk of ignition in explosion hazard areas.

### 5.3 Assembly of the SPIDEX® coupling

• Clean the finish bore/spline before starting coupling assembly. The finish bore/spline must not contain preservatives after cleaning. Furthermore, the shaft ends must be cleaned and degreased.

Observe the manufacturer's instructions for use of cleaning agents.

- Install the two coupling hubs onto the shaft of the drive side and the output side.
- Insert the spider into the cam geometry on either side.
- If you have an assembly drawing, fix the two coupling hubs as indicated on the drawing. The E dimension, Table 1-3, must be checked and adjusted if necessary.
- If you do not have an assembly drawing, join the unit together axially until the E dimension, Table 1-3, is reached.
- If the units are already fixed on the motor and pump side, adjust the E dimension, Table 1-3, by axially moving the coupling hubs.
- Secure the hubs by tightening the radial set screws DIN EN ISO 4029 with annular cutting edge. Refer to Table 8 for the tightening torques.
- If you are installing a SPIDEX® coupling hub in clamping version, refer to Table 9 for the tightening torque.

If the supplied coupling is used in explosion hazard areas, the set screws for hub mounting as well as all screw connections must be secured against "selfloosening", e.g. bonding with Loctite (medium-strength).

#### 5.4 Types of shaft misalignments and values

In order to ensure a long service life of the coupling and to avoid danger when used in explosion hazard areas, the shaft ends must be aligned precisely. It is essential to comply with the specified shaft misalignment values, see Table 10. If the values are exceeded, the coupling will be damaged. The more precisely the coupling is aligned, the greater its service life.

- The shaft misalignment values shown in Table 10 are maximum values that must not occur at the same time. In the case of simultaneous occurrence of radial and angular offset, the permissible shaft misalignment values may only be used proportionally.
- Use a dial gage, ruler or feeler gage to check whether the permissible shaft misalignment values from Table 10 are observed.

SPIDEX® Operating/Assembly Instructions

### 5.5 Information on the finished bore

The finished bores must not exceed the maximum permissible bore diameter "Ød" (Table 1-3). A larger finished bore than the maximum permitted bore diameter may cause damage to the hub. There is a risk of serious injury or death from the resulting damage.

- If the hub bore is made by the customer, it is essential that the concentric and axial runout accuracy is maintained.
- The maximum bore diameters "Ød" must not be exceeded.
- The hubs must be carefully aligned when making the finished bore.
- A locking screw for the axial locking of the hub according to DIN EN ISO 4029 with annular cutting edge or an end washer must be provided.

Figure 6 : Distance and size of set screw

The customer bears the sole responsibility for the machining operations carried out in the case of pre-/undrilled hubs. R+L Hydraulics GmbH does not assume any claim for warranty arising from insufficient rework.

| Size                         | 14  | 15 | 19 | 24 | 28 | 38 | 42 | 48 | 55  | 65  | 75  | 90  | 100 | 110 | 125 |

In case of hubs with a keyway, the groove tolerance must be produced according to ISO JS9 under "normal" operating conditions. In case of increased operating conditions, such as "frequently changing direction of rotation", "shock load with large acceleration masses", etc., the nut tolerance must be produced in accordance with ISO P9. The groove should generally be inserted between the jaws. The threaded hole of the locking screw for the axial locking of the hub is inserted either on the groove or opposite the groove, depending on the bore.

The transmissible nominal torque of the shaft-hub connection must be checked by the customer and is subject to his responsibility.

### 6.0 First Use

The following checklist must be carried out before first use:

- The set screw is fixed and mounted with the correct tightening torque
- The "E" dimension is observed
- The correct orientation of the hubs is given
- A coupling guard against accidental contact or falling of objects according to DIN EN ISO 12100 and the directive 2014/34/EU is provided

If a closure or a cover with a gap or several openings is present in the coupling guard, it must be designed in accordance with DIN EN ISO 13857. An aluminum Bellhousing from R+L with a magnesium content below 7.5%, can be used as coupling guard. In addition, the aluminum Bellhousing can also be equipped with a damping ring made of NBR. The cover must be connected to the potential equalization line and must not be electrically conductive. The cover may only be removed when the machine is stopped.

### When used in explosion hazard areas, it must be ensured that

- the screw connections are secured to prevent self-loosening (e.g. with Loctite medium-strength).
- no dust has accumulated between the cover and the coupling. Under no circumstances must the coupling transmit the torque in a "dust cloud".
- for device group II, the covers of the coupling guard without heat vents are made of a non-rusting steel.
- if a cover is in place for the coupling in the "Device group I M2", the cover must not be made of a light metal material and must meet high mechanical requirements.
- no electrostatic charge is expected for coated hubs with a film thickness of max. 200 µm. In general, for coated hubs, the conductivity and film thickness requirements must be observed. A coupling with a coating with film thickness of more than 200 µm is not permitted in the explosion hazard area. When using a coated or painted coupling, the electrical conductivity with the adjacent components must be present so that potential equalization is not prevented by the added coating or paint coat. After coating the coupling, it is important to make sure that the designation of the coupling remains readable.

The system must be isolated immediately if any irregularities in the drive train are noticed. The cause of the error must then be found and eliminated.

### 7.0 Spare Parts Management & Disposal

A spare stock of important spare parts at the place of use is a basic requirement to ensure the coupling is ready for use.

For contact addresses of the field service staff or cooperation partners for spare parts/orders, see the R+L Hydraulics homepage at <u>www.rl-hydraulics.com</u>.

In order to protect the environment, please dispose of the products or the packaging at the end of its useful life in accordance with the applicable legal regulations or guidelines.

- **Metallic products:** Metallic products belong to metal scrap and must be cleaned before.
- **Plastics:** Plastic products must be disposed of properly or by a suitable company.

### **8.0 Maintenance and Inspection**

**SPIDEX**® is a low-maintenance jaw coupling. The following points must be observed during maintenance:

- The coupling must be visually inspected at least once a year.
- Check the alignment of the coupling and realign if necessary.
- Visually check whether the components are damaged.
- Check the bolt connections.

The spider can wear out due to friction, so that the coupling halves can contact each other and cause a spark of ignition. For this reason, wear should be checked for the first time after 3000 hours and again every 3000 hours or at the latest after 6 months. If the wear is not acceptable, replace the spider.

### 8.1 Information on wear values

During maintenance, it must be ensured that the wear on the spider is within the wear limit, among other things. There are several inspection methods:

- <u>During operation:</u> If the coupling is still in operation, the wear can be checked using electronic devices such as a lightning device (strobe lamp) or a suitable high-speed camera. If other methods are used, they must ensure the same accuracy as a test at standstill
- <u>Standstill:</u> When checking while at standstill, a feeler gage can be used to check the gap between the spider and the jaw on the hub, see Figure 7. The thickness of the feeler gage must be less than the maximum allowable wear values listed in Table 11.

The exact alignment of the shaft ends is necessary to avoid possible dangers when used in explosion hazard areas and promotes the long service life of the coupling used. The shaft misalignment values of the coupling must always be observed, otherwise an increased wear on the components can occur and the coupling may be damaged.

Figure 7 : Method with feeler gage

Figure 8 : Wear on the spider

# The spider must be replaced if the measured wear is greater than the value "A" in Table 11.

### 9.0 Errors and faults

If a SPIDEX® coupling is not used for its intended purpose, the following errors or faults may occur. The customer must avoid these errors and that the specifications of the operating and assembly line are observed. The information listed is only used as a guide to

troubleshooting. When searching for the cause of failure, the adjacent components must also be included in the fault analysis.

Directive 2014/34/EU requires the user and the manufacturer to pay particular attention to the use of the coupling, as the coupling can become an ignition source in the event of improper use.

#### Common errors:

- The necessary data for the design of the coupling were not provided or passed on incorrectly.
- No calculation of the shaft-hub connection has been performed.
- Products with transport damage were nevertheless assembled.
- The permissible temperature was not observed when mounting the hubs by warming them up.
- The fits of the hubs are not concentric to each other.
- Tightening torques have not been selected correctly.
- The assembly of the spider was neglected or incorrectly carried out.
- Maintenance intervals were not observed as prescribed.
- Third-party products were installed.

### 10.0 Important information for explosion hazard areas

If the SPIDEX® flexible shaft coupling is operated in or in connection with an explosive environment, the following additional information must also be observed.

The SPIDEX® coupling is a device within the meaning of Directive 2014/34/EU and may only be used in or in connection with an explosive environment if the following instructions are observed.

### 10.1 Permissible coupling versions for the EX area

- Hub with keyway and set screw/cross pin
- Hub without keyway and set screw/cross pin
- Hub with spline and set screw
- Clamping hub with keyway; single slot
- Clamping hub without keyway; single slot
- Clamping hub with spline; single slot
- Clamping hub with keyway; double slot
- Clamping hub without keyway; double slot
- SPIDEX flange

### **10.2 Permissible coupling materials in explosion hazard areas**

The following hub materials may be used in explosion hazard areas:

- Sinter
- Gray cast iron
- Spheroidal cast iron
- Steel
- Die cast aluminum (but not in device group 1)

WARNING!

The individual materials are only partially suitable for the individual classification groups. Please refer to Chapter 10.3.1

| Protection Note   | Drawn:    | 02/05/2020 | Eata | Replacement for: | 10/05/2010 | Mboz |

#### 10.3 Explosion hazard area operating conditions

The SPIDEX coupling<sup>®</sup> is designed according to DIN EN ISO 80079-36 or DIN EN ISO 80079-38 without ignition sources according to the respective category. The use of the SPIDEX coupling in connection with an explosive environment depends on the size of the spider. The following approvals apply:

#### 10.3.1 Device groups

In device group I, category M2 or EPL Mb in all sizes up to A125/145 with the designation:

CE 🕼 I M2 Ex h Mb

T<sub>a</sub> according to operating and assembly instructions

In device group II, category 2G or EPL Gb and gas group IIC up to size A90/100 with the marking:

CE 🐼 II 2G Ex h IIC TX Gb

T  $_{\rm a}$  and TX according to operating and assembly instructions

In device group II, category 2G or EPL Gb and gas group IIB in all sizes up to A125/145 with the marking:

CE 🐼 II 2G Ex h IIB TX Gb

T<sub>a</sub> and TX according to operating and assembly instructions

In device group II, category 2D or EPL Db and dust group IIIC in all sizes up to A125/145 with the marking:

CE 🐼 II 2D Ex h IIIC TX Db

T<sub>a</sub> and TX according to operating and assembly instructions

#### 10.3.2 Temperature classes, ambient temperature and surface temperature

The permissible ambient temperature  $T_a$  as well as the max. surface temperature (for gases and/or dusts) result according to the color of the spider material as follows:

#### Table 8: Minimum ambient temperature

| Color Spider material    | Minimum ambient temperature |
|--------------------------|-----------------------------|
| blue 80° Shore A         | -40 °C ≤ Ta                 |
| white 92° Shore A        | -40 °C ≤ Ta                 |
| green 64° Shore A        | -20 °C ≤ Ta                 |
| red 95/98° Shore A       | -30 °C ≤ Ta                 |
| yellow 92° Shore A       | -50 °C ≤ Ta                 |
| light red 95/98° Shore A | -50 °C ≤ Ta                 |
| light green 64° Shore D  | -50 °C ≤ Ta                 |
| natural 95° Shore A      | -30 °C ≤ Ta                 |

| Protection Note   | Drawn:    | 02/05/2020 | Eata | Replacement for: | 10/05/2010 | Mboz |

| Color Spider material    | Maximum ambient temperature |
|--------------------------|-----------------------------|
| blue 80° Shore A         | T <sub>a</sub> ≤ 35 °C      |
| white 92° Shore A        | T <sub>a</sub> ≤ 65 °C      |
| Green 64° Shore D.       | T <sub>a</sub> ≤ 85 °C      |
| Red 95/98° Shore A.      | T <sub>a</sub> ≤ 75 °C.     |
| yellow 92° Shore A       | T <sub>a</sub> ≤ 95 °C      |
| light red 95/98° Shore A | T <sub>a</sub> ≤ 95 °C      |
| light green 64° Shore D  | T <sub>a</sub> ≤ 95 °C      |
| nature 95° Shore A       | T <sub>a</sub> ≤ 75 °C      |

Table 9: Max. Ambient temperature, temperature class and max. surface temperature

The maximum surface temperature TX is 25 K higher than the actual local ambient temperature.

The design limits provided in the SPIDEX ® assembly and operating instructions must be observed. The permissible displacement values must not be exceeded. The coupling must not be operated in the range of natural vibrations. Coupling-dependent parameters for the calculation of the self-oscillation are contained in the operating and assembly instructions.

Pre-drilled hubs must be finished with the tolerances specified by R+L. For shaft-hub connections according to the customer's specifications, the customer is responsible for the durability of the connection.

The coupling materials used must not be chemically influenced by the surrounding atmosphere. The resistance of the spider to various chemical substances is specified in the operating and assembly instructions. The resistance of the ring gear to other chemical substances can be requested from R+L.

The exposed surface of the ring gear can be statically charged. Improper charging can occur when the coupling is running in a dust spill. This must be prevented by the operator.

To prevent mechanical ignition sources, metal contact with the rotating coupling must be prevented. This can be done, for example, with a suitable coupling protection (fixed isolating protective device). Openings or gaps in/with the separating protective device must be at least IP 2X according to IEC 60529. In Group I, the coupling guard must be able to withstand the severe operating conditions.

In Group I, aluminum couplings are not offered.

The operator must ensure that the information on the intended operation is observed.

#### **10.4 Health and Safety Information**

If the SPIDEX® coupling is used as a component of a device or a module within the meaning of Directive 2014/34/EU, the manufacturer of the device must establish and confirm the conformity of this device or module with the said guideline before first use.

If the SPIDEX® coupling is used as a component of a device or a module within the meaning of Directive 94/9EG, the device manufacturer must establish and confirm the conformity of this device or module with the said Directive before first use. It is the responsibility of the operator to check whether the SPIDEX® coupling is suitable for operation in the actual explosive atmosphere based on the instructions for use.

| Protection Note   | Drawn:    | 02/05/2020 | Eata | Replacement for: | 10/05/2010 | Mboz |
|-------------------|-----------|------------|------|------------------|------------|------|
| Observe ISO 16016 | Reviewed: | 04/15/2020 | Mboz | Replaced by:     | 02/05/2019 | Eata |

In trouble-free operation, the SPIDEX® coupling has no effective ignition source. The operator must ensure trouble-free operation by checking, maintaining and repairing the system in accordance with the instructions in the operating instructions.

The operator must stop a coupling that is not working properly. The coupling must not be put back into operation until it has been repaired.

Maintenance or inspection work on the SPIDEX® coupling should not be carried out in an explosive atmosphere.

No burning, welding or separation work is required for maintenance and inspection.

Protective measures in accordance with Directive 1999/92/EC, e.g. according to DIN EN 1127-1 Annex a, must be taken on-site for work in an explosive atmosphere. Smoking, fire and open light must be prohibited.

#### 10.5 Installation and assembly

The coupling halves must be secured against axial movement. If the coupling halves are not tightened against a shaft shoulder, they must be secured with a locking screw. The locking screw must be secured against loosening with an adhesive, Loctite 243 or equivalent. The adhesive must have a temperature resistance of at least 125 °C (max. surface temperature 105 °C).

In the case of shaft-hub connections with a cross pin, the customer must secure the cross pin against loosening.

In order to prevent metal contact, the coupling halves must be fitted with the specified clearance "s".

All screws must be tightened to the specified torque.

The spider consists of an insulating material and prevents direct potential equalization between the coupling halves. Potential equalization between the coupling halves must be ensured on the system side.

| Protection Note   | Drawn:    | 02/05/2020 | Eata | Replacement for: | 10/05/2010 | Mboz |
|-------------------|-----------|------------|------|------------------|------------|------|
| Observe ISO 16016 | Reviewed: | 04/15/2020 | Mboz | Replaced by:     | 02/05/2019 | Eata |

### 10.6 Checks, inspection and repair

To prevent and detect faults, the following information must be observed in addition to the inspection notes in the operating and assembly instructions.

Faults must be rectified immediately, observing the repair instructions.

In daily checks, care must be taken for changes in running noise or vibrations.

The spider may wear out due to friction, so that the coupling halves can contact each other and cause a spark of ignition. Therefore, wear and tear must be checked regularly in accordance with the operating and assembly instructions. Replace the spider before improper wear occurs.

Only the manufacturer-specified and approved spare parts may be used to maintain the explosion protection concept.

### 10.7 Checking

In accordance with Directive 1999/92/EC, the SPIDEX coupling must be checked for correct assembly and correct functioning by a qualified person or by an employee of R+L Hydraulics GmbH, Werdohl, prior to first use. This check must be documented.

According to Directive 1999/92/EC, the SPIDEX coupling must be checked for correct functioning by a qualified person or an employee of R+L Hydraulics GmbH, Werdohl, at the latest after 3 years. This check must be documented.

### 11.0 Additional Information:

For all subsequent operations on the coupling components, which were not carried out by R+L Hydraulics GmbH, the customer bears the sole responsibility.

Any warranty claims are excluded.

Any rework on coupling components that are intended for use in explosion hazard areas, and which were not carried out by R+L Hydraulics GmbH, voids the EX-suitability immediately. Furthermore, the customer is solely responsible. Any warranty claims are excluded.

Below is the EC declaration of conformity for R+L Hydraulics of the SPIDEX jaw coupling. The customer may optionally obtain the Declaration of Conformity with the delivery of the coupling or by e-mail.

## **EU - Declaration of Conformity**

as defined in the explosion protection directive 2014/34/EU

The following company:

R+L Hydraulics GmbH Friedrichstrasse 6 58791 Werdohl

is solely responsible for ensuring that the operating & assembly instructions described in the

device: SPIDEX clutch

complies with the basic health and safety requirements of Directive 2014/34/EU, Annex II. The possible uses are derived from the labeling and the instructions for use in the "Ex" supplement to the assembly and operating instructions.

The following harmonized standards and/or normative documents have been considered, in whole or in part, with the design and manufacturing of this device:

| European Standards                                   | National standards / normative documents |
|--|--|
| DIN EN 1127-1:2011<br>DIN EN 15198:2007              |  |
